

SYSTEM AND METHOD FOR MOUNTING A COMPUTER COMPONENTABSTRACT

A system is provided for mounting a computer component. The system has at least one rail with first and second mounting portions. The first  
5 mounting portion defines a recess. The second mounting portion has at least one detent. The system also has first and second supports. The first support has an extension extending into the recess and allows sliding of the first mounting portion relative to the first support. The second support defines at least one aperture that receives the detent and limits sliding of the second mounting portion relative to the  
10 second support.
